SAPLING POLICY CHALLENGE

Policy Evidence Check

Release blockers with visible uncertainty

Twelve recorded calls to Banyan Sapling
Synthetic release approval, MFA and PHP evidence

github.com/Azuremis/mubit-night-shift

24 October 2026

Release approval evidence

Claim

Release r-42 is permitted for production deployment.

Policy requires approval for that release and all required tests to pass.
An explicit rejection blocks deployment.

Passing tests alone do not settle the approval question.

Exact synthetic evidence

Synthetic deployment record, 2026-10-24T08:20:00Z. Release: r-42. The release approver has explicitly rejected r-42 for production deployment. All required tests for r-42 have passed.

Recorded Sapling result

violation

Singleton prediction set

Source: deployment-rejected fixture and receipt-10-57703127.json. All records are invented.

Sapling integration and receipt flow

01 Input strings

`inputs.policy`

`inputs.evidence`

`inputs.claim`

Synthetic records and a claim under one explicit policy.

02 Local Node adapter

Validate, then reserve an attempt before the network request.

Forward the exact three strings.

Save the request and raw response.

Persistent ledger and shared filesystem reservation lock.
No automatic retry.

03 Sapling response

Calibrated status

Prediction set

Secondary raw label and scores

Timing and reported model hashes

Sapling performs classification.
The UI preserves the response and displays the source inputs.

```

```

Source: server.mjs. No fine-tuning or generated explanation in this integration.

Deployment approval: four predeclared cases

One shared policy and claim. Inputs and human references frozen before the four requests.

Synthetic case	Human reference	Calibrated status	Raw label	Set size
Approval and passing tests	supported	**unsure**	supported	4
Explicit rejection	violation	**violation**	violation	1
Missing approval	insufficient_information	**unsure**	violation	4
Contradictory approvals	inconsistent_context	**inconsistent_context**	inconsistent_context	1

Two distinct stop conditions. The approved case still returned unsure.

This app reviews evidence. It does not enforce a deployment gate or establish safe approval.

Source: diagnostics/deployment-approval/REPORT.md and receipts 09-12

Earlier MFA and PHP outcomes

The original eight calls remain part of the evidence. Asset and account records are synthetic.

Synthetic case	Human reference	Calibrated status	Raw label	Set size
Small MFA smoke	supported	**unsure**	supported	4
Expired exception	violation	**unsure**	violation	4
Current exception	supported	**unsure**	insufficient_information	4
Missing records	insufficient_information	**unsure**	insufficient_information	4
Conflicting records	inconsistent_context	**inconsistent_context**	inconsistent_context	1
PHP: Rollout only	insufficient_information	**unsure**	insufficient_information	4
PHP: Bound backport	supported	**unsure**	violation	4
PHP: Customer VPS	insufficient_information	**unsure**	violation	4

PHP backport expected supported and returned unsure. PHP scope: CVE-2026-109618 only.

Sources: original eight receipts and PHP_HOSTING_CASES.md. Raw labels remain secondary.

Observed behavior and limits

9 of 12

calibrated responses were unsure

Three singleton results: one violation and two inconsistent contexts.
These examples establish no general accuracy or automatic approval ability.

Model integration

All twelve responses report banyan-sapling, no fallback and zero generated tokens.

Local verification

10 mocked server tests passed.
No provider calls during documentation QA.

Unproven

General accuracy, production readiness, server security certification or real-site PHP remediation.

Sources: recorded receipts and VALIDATION.md. Exploratory synthetic sample only.

Reproduce and inspect

github.com/Azuremis/mubit-night-shift

```
cd sidequests/policy-evidence-check
npm test
npm start
```

Open http://127.0.0.1:4321
Replay saved receipts. The global 12-call budget is exhausted.

Public synthetic data only. Keep credentials, private records and session state out of commits.

Public app and video URLs: awaiting verified links

SamuraiFlow registration and rules acceptance: owner reported complete at 08:22 UTC.
Check-in and final submission completion are not established by that report.
